Design and Discovery

Understanding the Design Process

A 10-step Design Process is introduced and practiced in this session. The design process used for students' project development is the same one that guides the work of professional engineers and designers. In *Session 1: Jump Into Design*, students learn how to look at the world from a designed perspective by examining and redesigning everyday objects. In *Session 2: The Designed World*, students develop skills by thinking creatively about designed things they use. They also learn to identify problems that lead to opportunities for new design solutions.
