Embedded Computing

2nd Generation Intel® Core™ i7-2600, Intel® Core™ i5-2400 and Intel® Core™ i3-2120 Processor-based Platforms for Embedded Computing

Product Overview

These Intel® Core™ processors are based on the 2nd generation Intel® Core™ micro-architecture on 32nm process technology which offers enhanced media and graphics capabilities and performance while reducing overall platform power requirements. With support for both quad-core and dual-core configurations, these processors improve performance and efficiency of multi-threaded applications with the option for unprecedented hardware support of vital security and management functions. When paired with the Intel® Q67 Express chipset or Intel® B65 Express chipset, these two-chip platforms provide ideal solutions for embedded market segments such as retail and transaction solutions, digital signage, digital security surveillance, gaming, medical, communications, and industrial automation and control.

With the graphics engine integrated into the processor, these solutions provide enhanced media and 3D graphics performance compared with previous Intel Core processor-based platforms. The memory controller hub is also integrated into the processor, providing for lower memory latency. Full integration of the CPU, media/graphics capabilities and memory controller into the processor reduces overall platform footprint. While incorporating advanced technology, these processors remain software-compatible with previous IA-32 processors. Developers can also create one board design and scale their product line with a variety of processors using the same socket.

The new Intel® Advanced Vector Extensions (Intel® AVX) can dramatically increase signal processing performance when compared

to previous generations. Intel® AES New Instructions (Intel® AES-NI) on select processors helps accelerate data encryption, decryption, and improve performance.

Platform Features and Benefits

FEATURES	BENEFITS
Supports key embedded platform requirements	Ideal for compute-intensive embedded applications.
Extended lifecycle product support	Protects system investment by enabling extended product availability for embedded customers.
Embedded ecosystem support	Along with a strong ecosystem of hardware and software vendors, including members of the Intel® Embedded Alliance (intel.com/go/embeddedalliance), Intel helps to cost-effectively meet development challenges and speed time-to-market.
Intel® Advanced Vector Extensions	Accelerates compute performance for image and signal processing applications.
Intel® Turbo Boost Technology ² 2.0	Boosts performance for specific workloads by increasing processor frequency.
Intel® Hyper-Threading Technology ³	Enables simultaneous multi-threading within each processor core, up to two threads per core; reduces computational latency, making optimal use of every clock cycle.
Intel® Smart Cache Technology	Large on-die shared Last-Level Cache reduces latency to data, improving performance and power efficiency.
Intel® Quick Sync Video Technology	Increases speed for video conversion, editing and sharing for embedded applications such as video surveillance.
Intel® AES New Instructions (Intel® AES-NI)	New instructions added to the architecture help accelerate data encryption and decryption, and improve performance.
Intel® Clear Video HD Technology	Visual quality and color fidelity enhancements deliver spectacular HD media playback for embedded applications such as digital signage and gaming.
Intel® Intelligent Power Technology ¹	Automated energy efficiency reduces power consumption.
Integrated power gates	Reduces idle processor cores to near zero power when not in use to help conserve power and lower operating costs.
Automated low-power states	Adjusts system power consumption based on real-time processor loads.
Intel® vPro™ Technology ⁴	Remote management, flexible virtualization, and enhanced security capabilities enable solutions that are trusted and cost-effective.
Intel® Active Management Technology ⁵ (when paired with Intel® Q67 Express chipset)	The latest remote management and maintenance capabilities enable IT professionals to query, fix, and protect networked embedded devices, even when they're powered off, not responding or have software issues. Helps perform remote asset tracking and checks the presence of management agents virtually anytime. Also, devices can be remotely turned on/off to reduce energy consumption during non-peak operating times.
Intel® Virtualization Technology ⁶	Speeds the transfer of platform control and movement of data between the virtual machine monitor (VMM) and other platform agents (including guest operating systems and I/O devices). By lowering the workload on the VMM, this technology addresses many embedded system design challenges, like migrating legacy software, increasing real-time performance, and making applications more secure.
Intel® Trusted Execution Technology ⁷	Protects embedded devices and virtual environments against rootkit and other system-level attacks. Using an industry-standard TPM 1.2 to store keys and other protected data, this portion of Intel® vPro™ technology boots the BIOS, operating system and software into a "trusted" execution state, verifying the integrity of the virtual machine and protecting the platform from unauthorized access.
