Note: Not all optional connections are shown in this diagram. Refer to the Reference section of this Quick Start User Guide, your Intel® Server Board SE7520JR2 User Guide, and your server chassis documentation for additional connection information.

Common Problems and Solutions

For a list of hardware components that have been tested with this system, see: <http://support.intel.com/support/motherboards/server/se7520jr2/>

The system does not boot or show video at power-on.

- Check that +12V CPU power connector is plugged in. Without this cable the processors will not have any power.
- If configuring with only one processor verify that the processor is in the Primary Processor socket (CPU 1).
- Remove and replace DIMMs one bank at a time to isolate which one is causing problems.
- Remember, all DIMMs must be:
 - DDR-2 400-compliant registered SDRAM 184-pin gold DIMMs for SKUs SE7520JR2SCSID2 or SE7520JR2SATAD2
 - DDR266/333-compliant registered SDRAM 184-pin gold DIMMs for SKUs SE7520JR2SCSID1 or SE7520JR2SATAD1
 - The same speed.
 - From the same manufacturer.
 - Installed in pairs, beginning with DIMM 1A and DIMM1B.
 - Installed with no empty sockets in between filled sockets.
- Your power supply must provide a minimum of 450W with 2A standby current, which complies with the SSI EPS 12V specification.

The system sometimes works, but is exhibiting erratic behavior.

- This is typically the result of using an under-rated power supply. Make sure you are using at least a 450W power supply.
